This is a text about computer science.

Computer science developed from mathematics and since the 1960s it has been possible to study computer science as its own field.

In today's world computer science is everywhere and cannot be imagined away from any area of life.

With the introduction of AI this development has continued even further.

Since AI is now used everywhere for example in science and medicine many people fear losing their jobs.

Everyone who is interested in computer science should know people like Donald Knuth or Linus Torvalds.
